Jetties and Wharfs Aug 19 2022 For centuries, jetties and wharfs
have been designed and built around the world and play an important

role in contemporary ports. The difference in the use of jetties, piers
and wharfs is that jetties are frequently used for the transshipment and
storage of light materials and ro-ro traffic, while piers are generally
used for heavy loads like iron ore. That is why piers are mostly
designed and constructed like quay walls (which are beyond the scope
of this handbook). The designs were originally based on trial and error
and the insights of those who dared to conquer local conditions, such
as wind, waves, currents and soil composition. Design and
construction techniques have since evolved into the designs we see on
the coast or in river ports and seaports nowadays. The purpose of this
handbook is to provide insight and guidelines regarding aspects that
are important in the design of jetties and wharfs. Jetty-specific issues
such as loads, interfaces between materials, installations on jetties and
wharfs, as well as detailing aspects, are also covered. This handbook is
part of a series of Dutch port infrastructure design recommendations
that include the Quay Walls handbook and Jetties and Wharfs
handbook.
