Following the violent death of his father, Gershwin Burr descends into a seemingly inescapable depression until, not-so-accidentally, he discovers a remedy for his condition: he steals a book and finds his mood has lightened. Before long, he's stealing indiscriminately while refining his skills as a professional thief and amassing a small fortune. Despite mounting pressure from his wife to go straight and from his own tortured conscience, he can't find the desire or motivation to change. Uncertain about how to proceed, the matter is taken out of his hands when his secret is betrayed by someone whose identity is a mystery to him. Arrested, charged,

convicted and jailed, his search for repentance and for the identity of the person responsible for his demise, leave him in a state of perpetual unrest. That is, until the final day of his sentence, when the answers he's been seeking are at last revealed to him. Beautifully written and evocative, this novel contrasts the reverberations of trauma with long-held, often misguided, notions of who is, and is not, worthy of redemption.

This report provides guidance to structural engineers in the design of civil structures to resist the effects of terrorist bombings. As dramatized by the bombings of the World Trade Center in New York City and the Murrah Building in Oklahoma City, civil engineers today need guidance on designing structures to resist hostile acts. The U.S. military services and foreign embassy facilities developed requirements for their unique needs, but these the documents are restricted. Thus, no widely available document exists to provide engineers with the technical data necessary to design civil structures for enhanced physical security. The unrestricted government information included in this report is assembled collectively for the first time and rephrased for application to civilian facilities. Topics include: determination of the threat, methods by which structural loadings are derived for the determined threat, the behavior and selection of structural systems, the design of structural components, the design of security doors, the design of utility openings, and the retrofitting of existing structures. This report transfers this technology to the civil sector and provides complete methods, guidance, and references for structural engineers challenged with a physical security problem.
